

The README, that **fixes itself**.

Your setup docs, tested
from a clean machine.

6 Autonomous Agents

HARVEY · UNITY · MACH · DR.BO · LARP · ECHO

Arnav · Karmanya

Powered by - IBM BOB 2.0

01 THE PROBLEM

Setup docs are the only code nobody tests.

A new hire clones the repo, follows the README, and the first command fails. They debug alone. The maintainer never sees it.

19 of 31

real, popular READMEs broke on a clean machine.

HUMBLE audit v2-31, pinned commits, 27 Sep 2026

Follow the README on a clean machine, like a new hire.

Follow

every step, as written, in a fresh container

Break

record the exit code and log

Diagnose

rules first, IBM Bob for the long tail

Fix

smallest change, with evidence

Replay from zero

throw the machine away, run the corrected guide again

VERIFIED

corrected README

Setup Passport

brand art; the fix shown is real (GeekyAnts run)

03 ONE REAL RUN • GEEKYANTS/EXPRESS-TYPESCRIPT @ 6B9BB70E23

README.md:140 said

```
$ npm install
npm error ERESOLVE could not resolve dependency
peer typescript@"^2.7 || ^3" from awesome-
typescript-loader
```

DR.B0 (rule npm-peer-conflict) fixed it, LARP replayed from zero

```
$ npm install --legacy-peer-deps
```

VERIFIED

4 more breaks found on the way: a missing tool (nodemon), two undocumented services (MongoDB, Redis), a legacy Mongo driver.

5 / 5

breaks found / fixed

1m53s

clone to running, from zero

0

need a human

0

Bobcoins (rules handled it)

04 31 REAL REPOS, AUDITED FROM ZERO

31

READMEs audited at
pinned commits

19

broke on a clean machine

53

breaks found

36

fixed, with evidence

14

VERIFIED: fixed and
replayed from zero

VERIFIED fixed and replayed from zero **FIXES PROVEN** found the breaks, proved its fixes, one step needs a person
no setup docs 2 failed 1 inconclusive 1 CI-only 1

Six agents. One clean replay.

HARVEY

Scout

reads manifests: runtime pins, env templates, services

UNITY

Planner

turns the prose README into ordered, runnable steps

MACH

Runner

runs each step as written in a fresh container

DR.B0

Doctor

diagnoses the break: 40+ rules, then IBM Bob

LARP

Verifier

throws the machine away, replays from zero

ECHO

Scribe

README diff, Setup Passport, FIRSTRUN.md report

Rules first. Bob for judgment. Verify always.

Rules first

Deterministic doctor and guard rules. Free, instant, offline. Known breaks never cost a Bobcoin.

IBM Bob judges

Custom modes (doctor, planner, debugger, security) with redacted evidence and a hard Bobcoin cap per call. Bob can only tighten a security verdict, never loosen it.

Verify always

Nothing Bob says counts until the replay from zero passes.

11 → **14**

VERIFIED repos after one IBM Bob pass
10 hard repos rerun • **4.58 Bobcoins** total

Once the setup is proven, HUMBLE walks your machine through it.

Dock

the crew's live state and a Bobcoin meter

Lens

Ctrl+Shift+Space, circle an error: proven fix, or ask Bob

HUMBLE console guide

step by step, asks before it runs; debugger diffs your machine vs the proof

Security guard

every command: ok / warn / block before it runs

Spatial pointing + EMO-style mascot

finds the error line on screen and beams at it

mascot states from lens/humble/robot-states.png (design sheet)

Four surfaces.

README CI Action

a check on every PR that keeps setup docs honest

planned

Desktop guide

Dock, Lens, console guide and security guard for new hires

shipped

Prove it live

paste a public repo: docs-vs-code conflicts in ~2 s, replay of a real verified run

live on the web

Audits at scale

parallel runs across many repos, one report

31-repo audit done

Our plan, not traction.

Free where it spreads. Paid where it saves teams hours.

Open source

free

Public repos: the CLI, the web check and a verified badge in the README.

Teams

per private repo / month

Private repos, CI Action, the desktop guide for every new hire.

Paid audits

per engagement

For dev-tool companies: prove every quickstart and example repo works from zero.

Others check or plan your setup. HUMBLE fixes the README itself, proves it from zero, then walks your machine through it with a debugger and a security guard.

DAY-ONE READY

runs setup commands, scorecard
of what wasn't verified

DEVONBOARD

checks your environment,
generates guidance

HUMBLE

clean machine, replay from zero,
README fix + Passport, a 31-repo audit,
the on-screen guide

The README,
that **fixes itself.**
