

DEVELOPER ONBOARDING · CLEAN-MACHINE VERIFICATION

Your README, proven on a clean machine.

Setup docs drift quietly. HUMBLE follows your instructions in an isolated sandbox, fixes what breaks, and replays every repair from zero to prove your README works.

- Six-Agent Pipeline
- Zero-Guess Repairs
- Proven from Zero

THE BROKEN DAY-ONE EXPERIENCE

Day one is where setup docs fail.

Nobody breaks docs on purpose. A runtime updates, a service is added, or an implicit step lives only in a senior dev's head. The newcomer finds out on day one—alone.

64%

of audited public READMEs broke immediately on a clean machine (21 of 31 repos).

72%

of engineering new hires take over a month to ship their first 3 PRs (Cortex 2024).

\$19.2k

wasted engineering salary per developer onboarding environment friction (Atlassian 2025).

PROOF-DRIVEN DEVELOPER ONBOARDING

Three steps. Verified from zero.

HUMBLE is not a markdown linter or a doc editor. It acts as your next teammate on a brand-new machine, executing and validating reality against documentation.

01 · READ

Audit Docs vs Code

Extracts setup steps from README and cross-checks against manifests, Dockerfiles, lockfiles, and CI configurations to detect static drift in seconds.

02 · EXECUTE

Run on Clean Machine

Launches an isolated Docker container with zero cache. Executes step-by-step; when commands fail, diagnoses the exact root cause.

03 · REPLAY

Prove Fix from Zero

Replays the complete repaired setup from scratch in a clean container. Hands back an updated README with a cryptographically verifiable proof.

SPECIALIZED COLLABORATIVE CREW

Six agents, one mission: H • U • M • B • L • E

A deterministic pipeline orchestrated by IBM Bob 2.0. Each agent owns a distinct phase of onboarding verification.

01 • H HARVEY Scout: Reads repo facts, manifests, engines, services & ports.	02 • U UNITY Planner: Sequences docs commands into a structured plan.	03 • M MACH Runner: Runs execution inside a clean container sandbox.	04 • B DR.BO Doctor: Diagnoses breaks using rules + IBM Bob 2.0 fallback.	05 • L LARP Verifier: Replays repaired setup from zero on a clean machine.	06 • E ECHO Scribe: Generates reproducible logs.
---	--	---	--	---	---

Architected for reproducible, zero-hallucination agent execution

RIGOROUS REAL-REPO BENCHMARK

Tested on 31 public repositories.

Every audit runs pinned commits of real GitHub open-source repositories in production runtimes (Node, Python, Go) with zero synthetic mocking.

READMEs Failed on Day 1

11

Repaired & Verified

53s

GeekyAnts 4/4 Replay

Case Study: GeekyAnts/express-typescript (1.2k ★)

README instructions omitted MongoDB and Redis background services, failed peer dependencies under modern npm, and pointed to a wrong directory. HUMBLE caught all 4 breaks, applied surgical rule fixes, and got the app clone to running in 53 seconds.

ENTERPRISE INTELLIGENCE INTEGRATION

Where IBM Bob 2.0 delivers the advantage.

Deterministic rules solve 80% of common environment bugs instantly and for free. IBM Bob steps in as the core cognitive engine for the hard 20%.

CORE REASONING

DR.BO Engine

When unknown stack traces or obscure compile failures occur, Bob reads the repository manifests, logs, and AST to output structured, minimal JSON remedies with zero hallucination.

NEWCOMER COPILOT

Bob Guide Mode

Transforms proven run passports into an interactive, step-by-step terminal copilot inside Bob IDE, ensuring newcomers never stall on environment setup.

MULTIMODAL DEBUGGING

HUMBLE Lens

Developers circle any failure, error dialog, or diff on the screen. Lens matches against proven fixes or patterns for immediate explanation and fix commands.

TAM / SAM / SOM SIZING

A massive, neglected friction point.

Over 30 million active developers worldwide lose an average of 4.2 hours per month to onboarding hurdles, outdated READMEs, and broken local toolchains.

\$4.2B

TAM · Global Developer Experience & Onboarding Software Market by 2028.

\$850M

SAM · Enterprise teams adopting internal developer portals (IDPs) and DevEx platforms.

\$92M

SOM · Initial target: 12,000 engineers modernizing CI and developer onboarding.

WHY HUMBLE WINS

Proof from zero vs static assumptions.

Existing tools either containerize the app or format markdown. HUMBLE is the only solution that actively follows setup docs, fixes breaks, and proves it.

FEATURE	HUMBLE	DEVPOD / CODESPACES	RUNME	DOC
Clean-Machine Replay Proof	✔ Full Zero-Replay	✗ Preconfigured Only	✗ Manual Execution	✗ Br
Automated Break Repair	✔ Rules + IBM Bob 2.0	✗ No Repairs	✗ No Repairs	✗ As
Rewrites Human README	✔ Verified Output	✗ Dockerfile Only	✗ Markdown Runner	✗ Tes
Zero-Cache Sandbox Isolation	✔ Ephemeral Containers	✔ VM / Container	✗ Host Machine	✗ Ho

Unique defensibility: Automated diagnosis + clean replay verification

OPEN CORE & ENTERPRISE MONETIZATION

Scalable bottom-up adoption.

Open-source CLI captures individual developer trust; hosted team and enterprise platforms monetize continuous drift prevention in CI.

COMMUNITY Open Source CLI Free Forever Local Docker verification, open-source rules engine, instant GitHub repository check, and FIRSTRUN.md export.	PRO / TEAMS Team Cloud \$19 / user / mo Hosted sandbox verification, GitHub PR automation bots, shared run passports, and Bob Guide mode workspace sync.	ENTERPRISE Continuous Guard \$49 / user / mo Automated pre-merge CI drift prevention, pSSO/SAML, dedicated Bob compute, and S

THE JOURNEY TO V1.0

Built with passion by Team HUMBLE.

Core Team · IIT Jodhpur

Arnav Yadav — Product Architecture, Clean Sandbox Engine, Pipeline Design.

Karmanya Patil — Doctor Rules, Multi-Agent Motion Systems, Audits.

Pair-programmed with Claude Code, Antigravity & IBM Bob 2.0

Immediate Roadmap

Q4 2026: GitHub Marketplace App + PR self-healing check.

Q1 2027: Multi-container Kubernetes & docker-compose support.

Q2 2027: Deep IBM watsonx.ai enterprise integration & catalog sync.
